

**2025 Annual Drinking Water Quality Report**  
**Naval Air Station Pensacola Saufley Field**

Naval Air Station (NAS) Pensacola Saufley Field's drinking water is in compliance with all United States Environmental Protection Agency (EPA) water quality standards and we're very pleased to provide you with this year's Annual Water Quality Report. In 2025, NAS Pensacola Saufley Field Water System testing resulted in detection of 18 contaminants, none above the EPA accepted level for drinking water. Detailed information regarding Saufley Field Water System treatment and testing is included within this report. NAS Pensacola remains committed to providing you with a safe and dependable supply of drinking water.

**Where Does My Water Come From?**

In 2025, ECUA sourced water from 28 active wells distributed through its service area that pump water from the Sand-and-Gravel Aquifer. In general, ECUA customers receive water from the wells (two to five) located closest to their residence. ECUA wells are operated as separate treatment plants to allow for adjustment of water quality parameters for maximum operational efficiencies and compliance with regulatory standards.

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material. It also can pick up substances resulting from the presence of animals or from human activity.

The Sand-and Gravel Aquifer is a prolific, high-quality source of water for our community. Because it does not have a confining layer above it, virtually everything that falls on the ground has the potential to affect the quality of our water supply. ECUA is well aware of this threat to groundwater and over the years has worked with Escambia County and the City of Pensacola in strengthening their Wellhead Protection Ordinances.

There are Granular Activated Carbon (GAC) filters installed on sixteen (16) wells for iron or organic contamination removal and assist with PFAS removal. Basic treatment includes calcium hydroxide (lime) for pH adjustment; phosphoric acid for corrosion control in the distribution system and home plumbing; and chlorine for disinfection. Hydrofluosilicic acid (fluoride) has historically been added at select wells to help prevent tooth decay. However, all fluoride treatment was discontinued in June 2025 to comply with Florida Senate Bill 700.

ECUA regularly monitors your drinking water for total coliform bacteria that are not generally harmful themselves, but are naturally present in the environment, and typically serve as an indicator that other bacteria may be present. This is a process that we take very seriously and implement carefully each month.

Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, and septic systems.
- Radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities.

To ensure that tap water is safe to drink, the EPA prescribes regulations, which limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water, which must provide the same protection for public health.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline at 1-800-426-4791.

In 2025, the Florida Department of Environmental Protection (FDEP) performed a Source Water Assessment on ECUA's water. Assessments are conducted to provide information about any potential sources of contamination in the vicinity of their wells. There are 63 potential sources of contamination identified for this system, with a low to moderate susceptibility level. ECUA's Wellhead Protection Program helps to protect the integrity of the ECUA water system. The assessment results are available on the FDEP Source Water Assessment and Protection Program (SWAPP) website at [prodapps.dep.state.fl.us/swapp/](http://prodapps.dep.state.fl.us/swapp/) or they can be obtained from ECUA's Water Production Regulatory Compliance Coordinator at (850) 969-6629.

Emerald Coast Utility Authority and the NAS Pensacola Saufley Field routinely monitors for contaminants in your drinking water according to Federal and State laws, rules, and regulations. Except where indicated otherwise, this report is based on the results of our monitoring for the period of January 1 to December 31, 2025. Data obtained before January 1, 2025, and presented in this report are from the most recent testing done in accordance with the laws, rules, and regulations.

The Lead and Copper samples collected and analyzed in 2024 indicate that the NAS Pensacola Saufley Field water system is in compliance with the Lead and Copper Rule. Corrosion of pipes, plumbing fittings and fixtures may cause metals, including lead and copper, to enter drinking water. To assess corrosion of lead and copper, NAS Pensacola Saufley Field conducts tap sampling for lead and copper at selected sites triennially. The most recent set of lead and copper tap sampling is available for review. To view the lead and copper tap sampling data, visit

[https://depdms.dep.state.fl.us:443/Oculus/servlet/shell?command=getEntity&\[guid=32.1713351.1\]&\[profile=Sampling\]](https://depdms.dep.state.fl.us:443/Oculus/servlet/shell?command=getEntity&[guid=32.1713351.1]&[profile=Sampling])

Lead can cause serious health effects in people of all ages, especially pregnant people, infants (both formula-fed and breastfed), and young children. Lead in drinking water is primarily from materials and parts used in service lines and in home plumbing. NAS Pensacola Saufley Field is responsible for providing high quality drinking water and removing lead pipes but cannot control the variety of materials used in the plumbing in your home. Because lead levels may vary over time, lead exposure is possible even when your tap sampling results do not detect lead at one point in time. You can help protect yourself and your family by identifying and removing lead materials within your home plumbing and taking steps to reduce your family's risk. Using a filter, certified by an American National Standards Institute accredited certifier to reduce lead, is effective in reducing lead exposures. Follow the instructions provided with the filter to ensure the filter is used properly. Use only cold water for drinking, cooking, and making baby formula. Boiling water does not remove lead from water. Before using tap water for drinking, cooking, or making baby formula, flush your pipes for several minutes. You can do this by running your tap, taking a shower, doing laundry or a load of dishes. If you have an unknown service line or galvanized requiring replacement service line, you may need to flush your pipes for a longer period. If you are concerned about lead in your water and wish to have your water tested, contact NAS Pensacola Saufley Field Michael Keethler (850) 452-2114. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available at <https://www.epa.gov/safewater/lead>.

The Federal Environmental Protection Agency has revised the Lead and Copper rule for all public drinking water systems. They have mandated that drinking water systems produce an inventory list of all service line material. The service line is the piping that extends from our water main to the customer's meter as well as the piping that extends from the meter to the customer's home. NAS Pensacola Saufley Field has prepared this inventory in accordance with federal regulations. To view this service line inventory, contact Michael Keethler (850) 452-2114 of NAS Pensacola Saufley Field or visit

[https://depdms.dep.state.fl.us:443/Oculus/servlet/shell?command=getEntity&\[guid=32.1708802.1\]&\[profile=Sampling\]](https://depdms.dep.state.fl.us:443/Oculus/servlet/shell?command=getEntity&[guid=32.1708802.1]&[profile=Sampling])

The System-Wide Test Results table included in this report presents the results of compliance monitoring for the period of January 1 through December 31, 2025. As authorized and approved by EPA, the State has reduced monitoring requirements for certain contaminants to less often than once per year because the concentrations of these contaminants are not expected to vary significantly from year to year. Some of our data, though representative, are more than one year old.

In the table below, you may find unfamiliar terms and abbreviations. To help you better understand these terms we've provided the following definitions:

**Action Level (AL):** The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.

**Maximum Contaminant Level or MCL:** The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

**Maximum Contaminant Level Goal or MCLG:** The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

**Maximum residual disinfectant level or MRDL:** The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

**Maximum residual disinfectant level goal or MRDLG:** The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLG's do not reflect the benefits of the use of disinfectants to control microbial contaminants.

**Not Detected (ND):** means not detected and indicates that the substance was not found by laboratory analysis.

**Parts per million (ppm) or Milligrams per liter (mg/l)** – one part by weight of analyte to 1 million parts by weight of the water sample. One part per million corresponds to one minute in two years or a single penny in \$10,000.

**Parts per billion (ppb) or Micrograms per liter (µg/l)** – one part by weight of analyte to 1 billion parts by weight of the water sample. One part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000.

**Picocuries per liter (pCi/L)** – picocuries per liter is a measure of the radioactivity in water, a quadrillionth of a curie per liter.

**2025 CONTAMINANTS TABLE**

<b>STAGE 2 DISINFECTANTS AND DISINFECTION BY-PRODUCTS*</b>							
<b>Contaminant and Unit of Measurement</b>	<b>Dates of sampling</b>	<b>MCL Violation</b>	<b>Level Detected</b>	<b>Range of Results</b>	<b>MCLG</b>	<b>MCL</b>	<b>Likely Source of Contamination</b>
Chlorine (ppm) - Stage 1*	Jan-Dec 25	No	0.58	0.33-0.81	4.0 MRDLG	4.0 MRDL	Water additive used to control microbes
*Contaminant data marked with an asterisk are obtained from NAS Saufley Field only, all other contaminant data is from ECUA wells.							

<b>LEAD AND COPPER (TAP WATER)*</b>								
<b>Contaminant and Unit of Measurement</b>	<b>Dates of sampling</b>	<b>AL Exceeded</b>	<b>90th Percentile Result</b>	<b>No. of sampling sites exceeding the AL</b>	<b>Range of Tap Sample Results</b>	<b>MCLG</b>	<b>AL (Action Level)</b>	<b>Likely Source of Contamination</b>
Copper (tap water) (ppm)*	Jul – Dec 24	No	0.25	0	0.0051-0.43	1.3	1.3	Corrosion of household plumbing systems; erosion of natural deposits; leaching from wood preservatives
Lead (tap water) (ppb)*	Jul – Dec 24	No	12	2	ND-55	0	15	Corrosion of household plumbing systems; erosion of natural deposits
*Contaminant data marked with an asterisk are obtained from NAS Saufley Field only, all other contaminant data is from ECUA wells.								

<b>RADIOACTIVE CONTAMINANTS</b>							
<b>Contaminant and Unit of Measurement</b>	<b>Dates of sampling</b>	<b>MCL Violation</b>	<b>Level Detected</b>	<b>Range of Results</b>	<b>MCLG</b>	<b>MCL</b>	<b>Likely Source of Contamination</b>
Alpha emitters (pCi/L)	Apr 20– Aug 23	No	6.3	ND – 6.3	0	15	Erosion of natural deposits
Radium 226 + 228 (pCi/L)	Apr 20- Aug 24	No	3.66	ND – 3.66	0	5	Erosion of natural deposits

<b>INORGANIC CONTAMINANTS</b>							
<b>Contaminant and Unit of Measurement</b>	<b>Dates of sampling</b>	<b>MCL Violation</b>	<b>Level Detected</b>	<b>Range of Results</b>	<b>MCLG</b>	<b>MCL</b>	<b>Likely Source of Contamination</b>
Antimony (ppb)	May 23- Apr 24	No	0.24	ND-0.24	6	6	Discharge from petroleum refineries, fire retardants; ceramics, electronics, solder
Barium (ppm)	May 23- Apr 24	No	0.074	0.010 – 0.074	2	2	Discharge of drilling wastes; discharge from metal refineries; erosion of natural deposits
Beryllium (ppb)	May 23- Apr 24	No	0.64	ND-0.64	4	4	Discharge from metal refineries and coal-burning factories; discharge from electrical, aerospace, and defense industries
Chromium (ppb)	May 23- Apr 24	No	2.50	ND-2.50	100	100	Discharge from steel and pulp mills; erosion of natural deposits
Fluoride (ppm)**	May 23- Apr 24	No	0.99	ND-0.99	4	4	Erosion of natural deposits; discharge from fertilizer and aluminum factories. Water additive which promotes strong teeth when at the optimum level of 0.7 ppm
Lead (point of entry) (ppb)	May 23- Apr 24	No	0.35	ND-0.35	0	15	Residue from man-made pollution such as auto emissions & paint; lead pipe; casing & solder

INORGANIC CONTAMINANTS							
Contaminant and Unit of Measurement	Dates of sampling	MCL Violation	Level Detected	Range of Results	MCLG	MCL	Likely Source of Contamination
Mercury (ppb)	May 23-Apr 24	No	0.1	ND - 0.1	2	2	Erosion from natural deposits; discharge from refineries and factories; runoff from landfills; runoff from cropland
Nickel (ppb)	May 23-Apr 24	No	1.5	ND-1.5	N/A	100	Pollution from mining and refining operations. Natural occurrence in soil
Nitrate (as Nitrogen) (ppm)	Mar 25-Aug 25	No	3.7	0.28-3.7	10	10	Runoff from fertilizer use; leaching from septic tanks, sewage; erosion of natural deposits
Sodium (ppm)	May 23-Apr 24	No	9.3	2.7-9.3	N/A	160	Saltwater intrusion, leaching from soil
Thallium (ppb)	May 23-Apr 24	No	0.07	ND – 0.07	0.5	2	Leaching from ore processing sites; discharge from electronics, glass, and drug factories

VOLATILE ORGANIC CONTAMINANTS							
Contaminant and Unit of Measurement	Dates of sampling	MCL Violation	Level Detected	Range of Results	MCLG	MCL	Likely Source of Contamination
Tetrachloroethylene (ppb)	Jan – Oct 25	No	0.19 avg.	ND - 0.76	0	3	Discharge from factories and dry cleaners
Trichloroethylene (ppb)	Jan – Oct 25	No	0.49 avg.	ND - 0.78	0	3	Discharge from metal degreasing sites and other factories

\*\* All fluoride treatment was discontinued by ECUA in June 2025 to comply with Florida Senate Bill 700.

**PFAS Update**

PFAS are man-made chemicals often found in common consumer products such as coatings, like food packaging, outdoor clothing, carpets, leather goods, personal care products, cosmetics and more. Certain types of firefighting foams—historically used by the U.S. military, local fire departments, and airports to fight oil and gasoline fires—may also contain PFAS. The rapidly increasing use of PFAS products over decades has led to PFAS now being present in the environment, including ground water and surface water sources which most public and private drinking water utilities use as a source of their raw water.

The ECUA is currently testing for PFAS as part of new EPA regulations under the Safe Drinking Water Act. Water systems must meet the newly implemented drinking water standards by the 2029 compliance deadline, although the EPA has indicated that they plan to extend the deadline to 2031.

ECUA’s initial test results will be included in the 2026 Water Quality Report, which will be available by July 1, 2027. The ECUA already has GAC treatment systems installed at the majority of their wells that remove PFAS along with other contaminants. ECUA is working diligently to install cost-effective PFAS treatment systems at the remaining facilities, where needed, in advance of the compliance deadline.

Additional information related to PFAS is available on the ECUA website at <https://ecua.fl.gov/live-green/our-water-supply>.

**Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbiological contaminants are available from the Safe Drinking Water Hotline at 1-800-426-4791.**

If you have any questions about this report, please contact Michael Keethler (850) 452-2114.

If you have any questions concerning the water that ECUA provides, please contact ECUA’s Water Production Regulatory Compliance Coordinator at (850) 969-6689. ECUA encourages their valued customers to be informed about their water utility. ECUA Board and Committee meetings are held in the boardroom of the ECUA Administration Building, 9255 Sturdevant St., Pensacola, FL 32514. For a complete schedule of meetings, please contact the Executive Assistant, Ms. Amanda Miller, at (850) 969-3302, or visit on-line at [www.ecua.fl.gov](http://www.ecua.fl.gov). The ECUA Water Quality Report for 2026 will be published by July 1, 2027.
